2. the Patient-Centered Medical Home Apr 09 2021 The United States spends a greater proportion of its gross domestic product on health care than any other country in the world (17.6 percent in 2009), yet often fails to provide high quality and efficient health care. U.S. health care has traditionally been based on a solid foundation of primary care to meet the majority of preventive, acute, and chronic health care needs of its population; however, the recent challenges facing health care in the United States have been particularly magnified within the primary care setting. Access to primary care is limited in many areas, particularly rural communities. Fewer U.S. physicians are choosing primary care as a profession, and satisfaction among primary care physicians has waned amid the growing demands of office-based practice. There has been growing concern that current models of primary care will not be sustainable for meeting the broad health care needs of the American population. The patient-centered medical home (PCMH) is a model of primary care transformation that seeks to meet the variety of health care needs of patients and to improve patient and staff experiences, outcomes, safety, and system efficiency. The term "medical home" was first used by the American Academy of Pediatrics in 1967 to describe the concept of a single centralized source of care and medical record for children with special health care needs. The current concept of PCMH has been greatly expanded and is based on 40 years of previous efforts to redesign primary care to provide the highest quality of care possible. The chronic care model, a conceptual model for organizing chronic illness care that is associated with improved health outcomes, is the cornerstone of PCMH. Interventions based on the chronic care model (CCM) and focused on single conditions such as diabetes mellitus, asthma, chronic obstructive pulmonary disease, or depression have been shown to improve patient outcomes and/or quality of care. PCMH builds on this model and is intended to address the full range of patient-focused health care needs. As defined by physician and consumer groups, the core principles of the PCMH are wide-ranging team-based care, patient-centered orientation toward the whole person, care that is coordinated across all elements of the health care system and the patient's community, enhanced access to care that uses alternative methods of communication, and a systems-based approach to quality and safety. As part of the Closing the Quality Gap: Revisiting the State of the Science series of reviews by Evidence-based Practice Centers (EPCs), this systematic review was commissioned to identify completed and ongoing efforts to evaluate the comprehensive PCMH model, summarize current evidence for this model, and identify gaps in the evidence. Because the PCMH model is being implemented widely but the number of completed studies was expected to be small, the identification of ongoing studies was an important goal of this review. The Key Questions include: KQ 1. In published, primary care-based evaluations of comprehensive PCMH interventions, what are the effects of the PCMH on patient and staff experiences, process of care, clinical outcomes, and economic outcomes? KQ 2. In published, primary care-based evaluations of comprehensive PCMH interventions, what individual PCMH components have been implemented? KQ 3. In published, primary care-based evaluations of comprehensive PCMH interventions, what financial models and implementation strategies have been used to support uptake? KQ 4. What primary care-based studies evaluating the effects of comprehensive PCMH interventions on patient and staff experiences, process of care, clinical outcomes, or economic outcomes are currently underway? In these ongoing studies, what are the study designs, PCMH components, comparators, settings, financial models, and outcomes to be evaluated?

Reconsidering Dementia Narratives May 22 2022 Reconsidering Dementia Narratives explores the role of narrative in developing new ways of understanding, interacting with, and caring for people with dementia. It asks how the stories we tell about dementia in fiction, life writing and film both reflect and shape the way we think about this important condition. Highlighting the need to attend to embodied and relational aspects of identity in dementia, the study further outlines ways in which narratives may contribute to dementia care, while disputing the idea that the modes of empathy fostered by narrative necessarily bring about more humane care practices. This cross-medial analysis represents an interdisciplinary approach to dementia narratives which range across autobiography, graphic narrative, novel, film, documentary and collaborative storytelling practices. The book aims to clarify the limits and affordances of narrative, and narrative studies, in relation to an ethically driven medical humanities agenda through the use of case studies. Answering the key question of whether dementia narratives align with or run counter to the dominant discourse of dementia as 'loss of self', this innovative book will be of interest to anyone interested in dementia studies, ageing studies, narrative studies in health care, and critical medical humanities.

Integrating Behavioral Health and Primary Care Apr 28 2020 Integrated care incorporates behavioral and physical health services into primary care and specialty medical environments. Integrated care models are patient-centered; delivered by teams of medical professionals, utilize care coordination, and a population-based approach. This book is practical, office-based, and comfortably accessible to students, residents, faculty, and all mental health professionals, primary care and medical specialists. We examine and recommend applying collaborative care and other existing models of integrated care based on the existing literature. When there is no literature supporting a specific approach, our experts offer their ideas and take an aspirational approach about how to manage and treat specific behavioral disorder or problems. We assume the use of integrated team staffing including a primary care or specialist provider(s), front desk staff, medical assistant(s), nurse(s), nurse practitioners, behavioral health specialist(s), health coaches, consulting psychiatrist, and care coordinator(s)/manager(s).

Caring Across the Lifespan Aug 01 2020 Most scholars do not consider the long-term nature of caregiving, but rather focus on a specific developmental period (e.g., old age) or a specific disability (e.g., cancer). Yet the most important lessons about caregiving may occur at any age, regardless of disabilities or other limitations. Caregiving is a lifelong process. It begins in a mother's womb, continues throughout the lifespan, and ends after death.

Caring Across the Lifespan emphasizes caregiving as a process that occurs throughout one's life. It discusses infant care, the developmental needs of children and adolescents, the many caregiving issues in adulthood and mid-life, and finally end-of-life care and bereavement. Key coverage includes: Examining caregiving issues across a developmental perspective. Caregiving from infancy through early childhood through end of life. Mid-life and multigenerational bonds and responsibilities. Caregiver identity in older adults. Family caregiving at the end of life. This must-have volume offers a wealth of insights and ideas for researchers, practitioners, and graduate students across the caregiving fields, including psychology, social work, public health, geriatrics and gerontology, and medicine as well as public and education policy makers.

Clinical Manual for Assessment and Treatment of Suicidal Patients Jun 18 2019 Since the first edition of Clinical Manual for Assessment and Treatment of Suicidal Patients was published in 2005, advances have been made that

increase our understanding of suicidal and self-destructive behavior. Although clinicians cannot unerringly predict which patients will die by suicide, they can focus more successfully on early identification of suicidal behavior and effective intervention, and this new edition of the clinical manual thoroughly explores not only assessment of suicidality but what comes after an at-risk patient has been identified. The authors argue that treating specific psychiatric disorders is not enough to prevent suicide, and they offer clinicians the necessary information and strategies to bridge that gap. The authors' main premise is that suicide is a dangerous and short-term problem-solving behavior designed to regulate or eliminate intense emotional pain -- a quick fix where a long-term effective solution is needed -- and this understanding is the underpinning of the assessment and treatment strategies the authors recommend. The content of this new edition has been thoroughly reviewed and revised, and substantive changes have been made to specific chapters to ensure that the book represents the most current thinking and research, while retaining the strengths of the previous edition. The chapter on assessment has been revised to put the fundamental components of effective treatment in a clinical, case-oriented context and includes an easy-to-use assessment protocol that allows clinicians to determine where individual patients stand on seven dimensions (cognitive rigidity, problem-solving deficits, heightened mental pain, emotionally avoidant coping style, interpersonal deficits, self-control deficits, and environmental stress and social support deficits). The many issues involved in the use of psychotropic medications in suicidal patients are addressed in a new chapter, which includes information on the relevant classes of drugs (such as antidepressants and anti-anxiety agents) and the issues that may arise with their use, including side effects, degree of lethality, and tendency to aggravate suicidality on introduction and withdrawal of the medication. The chapter on special populations has been expanded to include adolescents, elders, and patients with co-occurring substance abuse or psychosis. Because of additional vulnerabilities, treating these groups may call for the use of added or special techniques to ensure the best therapeutic outcomes. Primary care physicians are the first point of contact for many patients, and they may require additional preparation in order to assess and respond to those experiencing suicidal thoughts. The chapter "Suicidal Patients in Primary Care" explores strategies for screening, recognizing, and assessing risk; treating the initial crisis; and developing a crisis management plan. "Tips for Success" appear at intervals, and "The Essentials" are included at the end of each chapter, highlighting the most important concepts. In addition, there are scores of helpful charts and exercises. Practical, accessible, and reader-friendly, the Clinical Manual for Assessment and Treatment of Suicidal Patients is not an academic book but rather is one designed to become an indispensable part of clinicians' working libraries. Residential Care Transformed Jan 18 2022 Residential care homes are an important resource for older people yet they remain stigmatized and under-valued. Drawing on data deposited at the University of Essex, UK this book revisits Peter Townsend's classic study of residential care in England and Wales, The Last Refuge, published in 1962. With the help of a hundred older volunteer researchers, the authors traced what happened to the 173 homes that Townsend visited. They also revisited 20 of the surviving local authority, voluntary and private homes so as to compare them then and now. Written in an engaging and accessible style, the book straddles the boundary between history and sociology and reviews: the policy context and the history of research into residential care for older people over the last 50 years; provides new insights into the continuing history of residential care for older people about what kinds of homes have survived and why; makes comparisons between particular homes today and in the past demonstrating not only substantial changes but also strong continuities; reveals persisting inequalities in the standard of care home provision in the early 2000s in England and Wales and discusses the ethical and practical challenges involved in designing a revisiting study, reusing archived data and in engaging older people as 'volunteer' researchers. The book includes some previously unpublished photographs from the Peter Townsend Collection which when set beside those taken in the early 21st century illustrate not only continuity and change in residential care but also in visual representations of older people.

The Question of Competence Nov 16 2021 Medical competence is a hot topic surrounded by much controversy about how to define competency, how to teach it, and how to measure it. While some debate the pros and cons of competence-based medical education and others explain how to achieve various competencies, the authors of the seven chapters in The Question of Competence offer something very different. They critique the very notion of competence itself and attend to how it has shaped what we pay attention to and what we ignore in the education and assessment of medical trainees. Two leading figures in the field of medical education, Brian D. Hodges and Lorelei Lingard, drew together colleagues from the United States, Canada, and the Netherlands to explore competency from different perspectives, in order to spark thoughtful discussion and debate on the subject. The critical analyses included in the book's chapters cover the role of emotion, the implications of teamwork, interprofessional frameworks, the construction of expertise, new directions for assessment, models of self-regulation, and the concept of mindful practice. The authors juxtapose the idea of competence with other highly valued ideas in medical education such as emotion, cognition and teamwork, drawing new insights about their intersections and implications for one another.

Face to Face with Emotions in Health and Social Care Jul 12 2021 This book draws from the everyday experiences as well as the harsh realities confronting behavioral care providers on the frontline. The book recounts the stories and sometimes disturbing emotions of people whose lives have undergone sudden change or even drastic trauma; people whose feelings of comfort and safety have been shattered by exposure to illness, abuse, death and bereavement. The perspectives and experiences of nurses, social care staff, patients, children and families are at the core of understanding the importance, challenges and therapeutic vitality of emotions. The 55 individuals on the frontline who took part in the interviews on which this study is based discuss the emotions associated with care in mental health, pediatric oncology, AIDS/HIV, as well as child protection and abuse, racism, refugee exile, poverty, and social exclusion. Their bravery, openness, and ability to communicate and share their emotions make this book possible.

Women, Work and Care of the Elderly Jan 26 2020 First published in 1999, this book is based on social policy research, taking a particular view of the nature of social policy, one that focuses on the direct impact of all public policies on the welfare of citizens and which defines policy as inclusive of all areas of policy development and implementation. The view of policy which clients and customers provide is thus a significant dimension of social policy. The research is one of the few studies which focuses specifically on carers who are also in the paid work force and want to remain in paid work and to fulfil their caring responsibilities. An overriding concern of the research is how workplaces, government policy and community attitudes can be changed to foster a better and more supportive environment for workers who are caring. The research points to the need to change workplace policies and organisational cultures to confer legitimacy on the felt obligation and responsibility to care for older relatives. The responsibility of employers are explored and the knowledge, competencies and time management skills demonstrated in unpaid caring work are found to match the 'skill get' generally required of a modern manager, thereby offering important lessons for employer and employee alike.

Acute Nursing Care Jul 20 2019 Delays in recognising deterioration, or inappropriate management of people in acute care settings can result in late treatment, avoidable admissions to intensive care units and, in some instances, unnecessary deaths. As the role of the nurse in healthcare settings continues to change and evolve, today's nursing and other healthcare students need to be equipped with the fundamental skills to recognise and manage deterioration in the patient in a competent and confident manner, appreciating the complexities of caring for those who are acutely unwell as you learn to become practitioners of the future. Using a body systems approach, and fully updated in light of new NEWS2 and NMC future nurse standards, as well as acknowledging the challenges faced by people with delirium in acute care settings, the second edition of this book provides a comprehensive overview of the essential issues in this important subject. Topics covered include recognition and identification of physiological and mental deterioration in adults; identification of disordered physiology that may lead to a medical emergency linked to deterioration of normal function; relevant anatomy and physiology; pathophysiological changes and actions that need to be taken; immediate recognition and response; investigations, diagnosis and management issues; and teaching and preventative strategies. Including case studies and test yourself questions, this book is an essential tool for student nurses who are required to undertake acute care experiences and are assessed in theory and practice.

Reassessing Social Work Practice with Children Jul 24 2022 Physical and mental abuse, gang-related violence, homelessness and neglect are just a few of the dangers that a child must face. Child welfare officers, school social workers, and family service providers have been the primary line of defense against these hazards, but in order to provide a more effective form of social care, these fields must be seen as an integrated whole. They must also have the skill to act as multidisciplinary teams. Taken from an issue of the journal Early Child Development and Care, Reassessing Social Work Practice with Children provides professionals with a dynamic orientation that offers a holistic approach to social work practice with children. This view encompasses any and all measures of practice designed to protect and promote the bio-psycho-social development of children, including education, protective services, and substitutive services.
